MIRION
TECHNOLOGIES

Mirion Technologies is comprised of over 1800 talented professionals, passionate about delivering world class products, services, and solutions in the world of radiation detection, measurement and protection. In partnership with our customers in nuclear power plants, military and civil defense agencies, hospitals, universities, national labs, and other specialized industries, Mirion Technologies strives to deliver cutting edge products and services that constantly evolve based on the changing needs of our customers.

Combining state of the art technology with exceptional customer service, Mirion Technologies is dedicated to providing an unmatched experience in radiation detection and instrumentation.

Mirion's Values - (ICAIR)

INTEGRITY

We uphold both the letter and the spirit of all relevant laws, regulations and policies.

COMMITMENT

We are committed to our stakeholders – customers, employees, and shareholders each of whom is critical to Mirion's success.

ACCOUNTABILITY

We meet commitments to our stakeholders in a disciplined, process oriented fashion; and accept clear accountability for our actions.

INNOVATION

We are creative and entrepreneurial in all aspects of our business, in order to ensure that our market leadership is extended well into the future.

RESPECT

We value teamwork, practicing intellectual honesty and candor, with a clear focus on the situation, not the individual.

Author's notes

Over my career in health physics starting with a US Army CBR unit at Dugway Proving Grounds in 1965 I have needed to quickly find that elusive data point that I just couldn't remember, even though I knew the information was in one of my several hundred reference books.

So, here it is today, the product of my work to assemble useful field information from a wide range of sources.

I must give credit to those individuals who put their efforts into creating the original data. Without their work, this document could not have been assembled.

My family has given me their unlimited support in my development of this reference book and in my projects all through my career. Sandy my wife of 30 some years and our two daughters Susan and Sarah and their excellent husbands, Bill Gilson and Rolfe Bergstrom, our son-in-laws, continue to provide me with a steady foundation that allows me to try out new concepts.

James T. (Tom) Voss, NRRPT, CHP Fellow of the Health Physics Society Northern New Mexico, 2011

PO Box 1362 Los Alamos, NM 87544 Phone: 505-920-1470

Fire Department:

Hospital:

Guidelines for Control of Emergency Exposures

- Use a dose limit of: (EPA-400)
- 5 rem (50 mSv) for all emergency procedures
 - 10 rem (100 mSv) only for protecting major property
 - 25 rem (250 mSv) for lifesaving or protection of large populations
 - > 25 rem (250 mSv) for lifesaving or protection of large populations only by volunteers and where the risks have been evaluated

EMERGENCY RESPONSE

SWIMS for Radiological and Other Emergencies

Only under extreme radiological conditions such as external radiation greater than 100 rem / hr or airborne radioactivity concentrations greater than 100,000 DAC would the radiological emergency take precedence over serious personnel injuries. Hazardous conditions such as atmospheres that are IDLH would require you to implement controls to protect the emergency responders. Therefore, you would not attempt to move a seriously injured person before medical personnel arrived unless the radiological or other hazardous condition presented a greater danger to that person and yourself.

Stop or Secure operations in the area. If applicable, secure the operation causing the emergency.

Warn others in the area as you are evacuating. Do not search for potentially missing personnel at this stage of the emergency.

Isolate the source of the radiation or radioactivity or other contaminant or hazard only if you understand the operation and are qualified to isolate the source.

Minimize individual exposure and contamination. Control the entry points to the area if possible.

Secure unfiltered ventilation. Evaluate the radiological or other hazardous condition and advise facility personnel on ventilation control.

HAZARD CONTROL PRIORITIES DURING MEDICAL EMERGENCIES

Immediate treatment by trained medical personnel should be sought for any serious injuries such as those involving profuse bleeding or broken bones. The order of priority should be to protect lives, protect property, and then to control the spread of contamination.

Identifying a Major Injury

Consider the following points in determining if the injury should be handled as a major injury.

- Any head injury (from base of neck to top of head)
- Any loss of consciousness
- Any disorientation
- Any convulsion
- Any loss of sensation
- Any loss of motor function
- Limbs at abnormal angles
- Amputations
- Any burn of the face, hands, feet, or genitals (chemical, thermal, or radiation)
- Any burn larger than the palm of your hand
- Any inhalation of any abnormal substance
- Profuse bleeding
- Abnormal breathing patterns

Major Injuries Occurring in Hazardous Areas

Protect yourself - consider the magnitude of any radiation field, airborne contamination, or other hazard.

Stay with the victim unless doing so puts you at immediate risk to life or health.

Don't move the victim unless there is a danger from some environmental emergency such as fire, explosion, hazardous material spill, or radiation field.

If you must move the victim, drag them by either the hands or the feet to a safe area.

Apply First Aid Only if you are trained to do so.

Secure help - yell or phone, but don't leave the victim unless necessary.

Send someone to meet the ambulance to guide the medical personnel to the victim.

Prepare the area for access by the medical team.

Begin a gross hazard evaluation of the immediate area near the victim, beginning with the victim.

Be sure to survey any object that caused the injury.

Provide information to medical personnel about the victim (what happened, how, when, location of phone and exits, indicate which areas on the victim are contaminated and include contamination values).

ACUTE RADIATION EFFECTS

0 – 25 REM

minimal decrease in white blood cell count for ~ 2 weeks
increase in risk of dying from cancer from US average risk of ~ 14 persons per 100 population to ~ 17 persons per 100 population (3 additional persons per 100 population will experience the onset of terminal cancer ~25 years after the acute exposure)

> 25 REM - ≤ 100 REM

small decrease in white blood cell count for > 2 weeks
increase in risk of dying from cancer to ~ 26 in 100

> 100 REM - ≤ 200 REM

moderate decrease in white blood cell count
25% of those exposed will experience nausea within a few hours
less than 5% of those exposed require hospitalization
increase in risk of dying from cancer to ~ 38 in 100

> 200 REM - ≤ 600 REM

major decrease in white blood cell count
~ 100% of those exposed will experience nausea within a few hours
appearance of bruises on skin (purpura)
pneumonia symptoms
hair loss
90% of those exposed require hospitalization
decrease in thinking ability for ~ 2 weeks
increase in risk of dying from cancer to ~ 74 in 100

600 REM - \leq 800 REM

all of the above symptoms will be present
100% of those exposed require hospitalization
~ 100% of those exposed will die within a few weeks
without medical treatment
increase in risk of dying from cancer to ~ 98 in 100

800 REM - \leq 2000 REM

all of the above symptoms will be present
diarrhea, fever, electrolytes imbalance, GI tract and
respiratory system failure
100% of those exposed will be incapacitated within hours
very few of those exposed will survive

> 2000 REM

100% mortality within a few days

Lymphocyte - white blood cells

Leukopenia - abnormally low white blood cell count

Purpura - purple discoloration of skin caused by blood
bleeding into the skin tissue

Pneumonia - inflammation of lung tissue, accompanied by
fever, chills, cough, and difficulty in breathing

Hematopoietic - decrease in the formation of blood cells

Ataxia - inability to coordinate voluntary muscular
movements

BEIR V 1990 800 excess deaths per 100,000 persons at 10
rem

4,000 Hiroshima survivors in excess of 50 rem dose had an
extra 300 incidences of cancer

(~ 7500 excess deaths per 100,000 at 50 rem)

(~ 1500 excess deaths per 100,000 at 10 rem)

RADIOACTIVITY

${}_Z X^A$	Z =	atomic # (number of protons)
	X =	element
	A =	mass # (number of protons and neutrons)
Decay	Alpha	${}_Z X^A \rightarrow {}_{Z-2} X^{A-4} + \alpha$
Modes	Beta Minus	${}_Z X^A \rightarrow {}_{Z+1} X^A + \beta^-$
	Beta Plus (Positron)	${}_Z X^A \rightarrow {}_{Z-1} X^A + \beta^+$
	Electron Capture	${}_Z X^A \rightarrow {}_{Z-1} X^A$

Relative Locations of Products of Nuclear Processes

			He ³ in	α in	
		β ⁻ out	p in	d in	t in
		η out	Original Nucleus	η in	
t out	d out	p out	β ⁺ out	e	
α out	He ³ out	η neutron t triton (H ³) β ⁺ positron	p proton α alpha e electron capture	d deuteron β ⁻ beta	

Use this chart along with the Table of the Elements to determine the progeny (and ancestor) of an isotope.

For example; we know ²³⁸Pu is an alpha emitter. The alpha decay mode tells us the mass # decreases by 4 (238 goes to 234) and the Z # decreases by two (94 goes to 92). The element with a Z # of 92 is Uranium. ²³⁸Pu decays to ²³⁴U.

As another example; we know ³⁶Cl is a beta emitter. The beta decay mode tells us the mass # stays the same and the Z # increases by one (17 goes to 18). The element with a Z # of 18 is Argon. ³⁶Cl decays to ³⁶Ar.

Radioactive Decay Calculation

$$A_t = A_0 e^{-\lambda t} \quad A_0 = A_t / e^{-\lambda t}$$

$$t = \ln(A_t / A_0) / -\lambda \quad \text{half-life} = -t \times 0.693 / \ln(A_t / A_0)$$

Where; A_t is the activity at the end of time 't'

A_0 is the activity at the beginning

λ is 0.693 divided by the half-life

t is the decay time

example 1:

What is the activity of Co-60 remaining 12 years after the Co-60 was produced ?

$$A_t = A_0 e^{-\lambda t}$$

λ is 0.693 divided by the half-life of Co-60 (5.271 y)

t is the decay time (12 years)

λ times t is $0.693/5.271 \times 12 = 1.578$

$$e^{-\lambda t} = e^{-1.578} = 0.206$$

$$A_t = A_0 \times 0.206$$

20.6% of the Co-60 activity remains after 12 years

example 2:

What is the half-life of a radionuclide that decayed to 32% in 28 days?

$$\text{half-life} = -t \times 0.693 / \ln(A_t / A_0)$$

$$\text{half-life} = -28 \text{ days} \times 0.693 / \ln(32/100)$$

$$\text{half-life} = -19.404 \text{ days} / -1.139 = 17.04 \text{ days}$$

RADIOACTIVE DECAY MODES OF COMMONLY ENCOUNTERED RADIONUCLIDES

These tables show the type of radiation, its energy in keV, and the % abundance of that energy for the parent. Only the most abundant energies are listed.

The exposure rate from these radionuclides do not include their short-lived progeny. Spontaneous fission, isotopic mixtures, impurities in mixtures, and shielding (including self shielding) should also be taken into account when estimating exposure rate.

**Gamma exposure at 30 cm vs Particle Size
in microns for commonly encountered radionuclides**

1000 μ = 1 mm (millimeter) = 0.03937 inches

100 μ is easily discernible with the naked eye

50 μ is not easily discernible with the naked eye

< 10 μ is typical size for airborne particles

**Activity in DPM vs Particle Size in microns
for oxide form of various isotopes**

	0.5μ	1μ	5μ	10μ	50μ
U ²³⁴	8.7E-3	0.07	9	69.7	8700
U ²³⁵	3.0E-6	2.4E-5	3E-3	0.02	3
U ²³⁸	4.7E-7	3.8E-6	5E-4	3.8E-3	0.47
Np ²³⁷	1.0E-3	8.0E-3	1.0	8	1000
Pu ²³⁸	25	201	2.5E4	2E5	2.5E7
Pu ²³⁹	0.09	0.73	91	730	9.1E4
Pu ²⁴⁰	0.33	2.7	333	2670	3.3E5
Pu ²⁴¹	151	1210	1.5E5	1.2E6	1.5E8
Am ²⁴¹	5.1	41.1	5140	4.1E4	5.14E6

Calculating Activity vs Particle Size

1. Volume of the particle is $V = 1/6\pi d^3$.
2. Use the density of the isotope listed in this reference.
3. Mass of the particle is $M = V \times \text{density}$.
4. Activity of the particle is $A = M \times \text{specific activity}$.

Correct the activity of the particle for the oxide form if you need that; the molecular weight of Pu²³⁸ is 238, the activity of the dioxide form must be reduced by the ratio of the molecular weight of the dioxide form to the molecular weight of Pu²³⁸. Multiply the calculated activity by 238/270 to get the activity of the dioxide form.

For particles larger than about 1μ the aerodynamic diameter is approximately equal to the physical diameter times the square root of the density. The 10μ diameter particle in our example would have an equivalent aerodynamic diameter of 34μ (10μ x the square root of 11.46). This must be taken into account in air sampling/monitoring situations.

RADIATION BIOLOGY

Maximum survivable dose: 1000 rem (10 Sv)

Cancer mortality rate \approx 900 excess deaths per 100,000 persons at 0.1 Sv (10 rem)

Radiation Dose Risk

Report

Additional Cancer Deaths

BEIR III 1980

3 in 10,000 per 1 rem (10 mSv)

(also Reg Guide 8.29)

BEIR V 1990

800 in 100,000 per 10 rad (0.1 Gy)

Hiroshima Survivors Incidence of Cancer

4,000 Hiroshima survivors who received doses greater than 50 rem showed an extra 300 incidences of cancer.

INTERNAL DOSIMETRY

Calculating CDE and CEDE ICRP 26/30

CDE = $I / nALI \times 50 \text{ rem}$ (0.5 Sv) nALI is the non-stochastic ALI

CDE = 50 yr committed dose equivalent to irradiated tissue

I = Intake

nALI = non-stochastic ALI = 50 rem (0.5 Sv) / h_{max}

h_{max} = greatest dose equivalent found in the exposure-to-dose conversion tables

CEDE = $I / sALI \times 5 \text{ rem}$ (50 mSv) sALI is the stochastic ALI

CEDE = 50 yr committed effective dose equivalent

$$\text{OR CEDE} = \sum_{i=1}^n W_T$$

CEDE = 50 yr committed effective dose equivalent to individual tissue

W_T = tissue weighting factor

Effective Dose Equivalent EDE = $H_E = \sum W_T H_T$

D.E. rate (Sv / hr) = $0.15 A(\text{TBq})E / r^2$

Calculating DAC and DAC-hours

DAC = ALI / 2000 hr at 1.2 E6 ml / hr

1 DAC-h = 2.5 mrem (25 μSv) CEDE if based on sALI **OR**
25 mrem (0.25 mSv) ref ICRP 26 CDE to an organ or tissue if based on nALI

DAC Fraction = $\sum_i (\text{concentration} / \text{DAC}) / \text{PF}$

DAC fraction x time (hours) = DAC-hours

INTERNAL DOSIMETRY

Intake I(Bq) = $A_t(\text{Bq}) / \text{IRF}_t$

Body burden q_t = $q_0 e^{-\lambda_{\text{eff}} t}$

CEDE or H_{50} = 50 mSv (5 rem) x I / ALI

TEDE = CEDE + Deep Dose Equivalent

INTERNAL DOSIMETRY

Effective Half-Life

$$t_{\text{eff}} = t_r \times t_b / (t_r + t_b)$$

where; t_r = radioactive half-life
 t_b = biological half-life

Effective Removal Constant

$$\lambda_{\text{eff}} = \lambda_r + \lambda_b$$

where; λ_r = decay constant = $0.693 / t_{1/2}$
 λ_b = biological removal constant = $-0.693 / t_b$

Calculating Internal Dose (ICRP 30)

$$H_{50} (T \leftarrow S) = (1.6E-10) U_s \text{ SEE}(T \leftarrow S)$$

H_{50} = 50 year dose equivalent commitment in sieverts

where SEE is the Specific Effective Energy modified by a quality factor for radiation absorbed in the target organ (T) for each transformation in the source organ (S) expressed in MeV/g.

$$\text{SEE} = \sum Y \cdot E \cdot AF \cdot Q / M_T$$

where;

Y = yield of radiations per transformation

E = average energy of the radiation

AF = absorbed fraction of energy absorbed in the target organ (T) per emission of radiation in the source organ (S)

Q = quality factor

M_T = mass of the target organ

U_s = number of nuclear transformations in the source organ (S) during the time interval for which the dose is to be calculated

EQUIVALENT DOSE, EFFECTIVE DOSE, and COMMITTED EFFECTIVE DOSE

ICRP 60 Equivalent Dose

$$H_T = \sum_R W_R D_{T,R}$$

H_T = equivalent dose in tissue T

W_R = radiation weighting factor

$D_{T,R}$ = absorbed dose averaged over tissue T due to radiation R

ICRP 60 Effective Dose

$$E = \sum_T W_T H_T$$

E = effective dose to the individual

W_T = tissue weighting factor

H_T = equivalent dose in tissue(s) T

ICRP 60 Committed Effective Dose

$$E(50) = \sum_{T=i}^{T=j} W_T H_T(50) + W_{\text{remainder}} \frac{\sum_{T=K}^{T=1} m_T H_T(50)}{\sum_{T=K}^{T=1} m_T}$$

E(50) = committed effective dose

W_T = tissue weighting factor for tissues & organs T to T

m_T = mass of the remainder tissues T to T

$W_{\text{remainder}}$ = 0.05 (the W_T assigned to the remainder tissues)

ICRP 23 REFERENCE MAN

Daily Water Intake = 2.2 liters / day

Breathing Rate = 2 E4 ml / min

Skin surface area = 18,000 cm²

There are approximately 10¹³ cells in the human body.

There are 140 g of potassium in standard man, 125 nCi

(4.625kBq) is K⁴⁰ which results in 0.25 mrem/wk or 13 mrem/yr

(2.5 μSv/wk or 0.13 mSv/yr) to the whole body. An additional

15 mrem/yr (0.15 mSv/yr) will occur when using a salt substitute.

RADIATION WEIGHTING FACTORS¹ (ICRP 60)

Type and Energy Range ²	Radiation Weighting Factor, W_R
Photons, all energies	1
Electrons and muons, all energies ³	1
Neutrons, <10 keV	5
10 keV to 100 keV	10
100 keV to 2 MeV	20
2 MeV to 20 MeV	10
> 20 MeV	5
Protons, other than recoil protons, energy > 2MeV	5
Alpha particles, fission fragments, heavy nuclei	20

¹All values relate to the radiation incident on the body or, for internal sources, emitted from the source.

²The choice of values for other radiation is discussed in Annex A of Publication 60.

³Excluding Auger electrons emitted from nuclei bound to DNA

ICRP 60 Tissue Weighting Factors

SDE, ME	50 rem	0.5 Sv
TEDE (general public)	0.1 rem	1 mSv

DOSE EQUIVALENT MEASUREMENT

Abbreviations from USNRC Reg. Guide 8.7

	Measurement Depth for External Sources (cm)	Density Thickness (mg / cm ²)
TEDE	1	1000
TODE	1	1000
LDE	0.3	300
SDE, WB ¹	0.007	7
SDE, ME ²	0.007	7

¹SDE, WB is the shallow dose equivalent to the skin of the whole body

²SDE, ME the shallow dose equivalent to a major extremity.

RADIATION INTERACTIONS

Charged Particles

Ionization, Excitation, *Bremsstrahlung* (β^-), Annihilation (β^+)

Neutrons

Scattering ($E > 0.025$ eV)

Elastic (energy and momentum are conserved)

Inelastic (photon emitted)

Absorption ($E \leq 0.025$ eV)

Radiative Capture (n, γ)

Particle Emission (n, α) (n, p) (n, n)

Fission (n, f)

Gamma or X-ray photons

Photoelectric Effect (generally ≤ 1 MeV)

Compton Scattering (generally 200 keV - 5 MeV)

Pair Production (minimum 1.022 MeV)

Scattered Photon

$$T' = T / [1 + T(1 - \cos \theta) / m_0 c^2]$$

where $c^2 = 931.5$ MeV / amu

Bremsstrahlung

emitted energy is $\sim 1/3$ of the electron energy

Photon Attenuation: $I_x = I_0 e^{-\mu x}$

Interaction Probability per gram:

Photoelectric $\propto Z^3 / E^3$

Compton independent of Z

Pair Production $\propto Z^1$

$$\mu_{\text{Total}} = \mu_{\text{pe}} + \mu_{\text{cs}} + \mu_{\text{cc}}$$

$$W_{\text{Air}} = 33.9 \text{ eV per ion pair}$$

$$\text{Specific Ionization} = S/W \text{ (i.p. / cm)}$$

SHIELDING MATERIALS

α	a single sheet of paper
β^-	low Z, such as plastic or aluminum
γ	high Z, such as tungsten
mixed β^-/γ	low Z, then high Z
neutron	hydrogenous material to thermalize (such as polyethylene) then neutron absorber (such as Cd, B, Li, Hf), then high Z to absorb "capture gammas"

Photon Half-Value Layers in CM

	100 KeV	600 KeV	1 MeV	2 MeV
U	0.005	0.25	0.48	0.78
W	0.008	0.35	0.58	0.82
Pb	0.012	0.52	0.90	1.35
Sn	0.06	1.20	1.38	1.80
Cu	0.18	1.01	1.70	1.65
Fe	0.25	1.15	1.32	1.55
Al	1.12	3.30	4.45	5.90
Concrete	1.8	3.8	4.6	6.2
Water	4.2	7.8	9.6	14.2

This table applies to a thin shield and no provision is made for buildup factor. Always perform a radiation measurement to confirm adequacy of shield.

Tenth-Value Thickness

Simply multiply the half-value thickness by the square root of 10 (3.162) to get the tenth-value thickness.

Example: A half-value thickness of concrete for Cs-137 gamma radiation is 3.8 cm.

The tenth-value thickness is 3.8 cm x 3.162 = 12 cm.

Photon Shielding Buildup Factors

MeV	Water	Aluminum	Concrete	Iron	Lead
0.5	2.52	2.37	2.19	1.98	1.24
1.0	2.13	2.02	1.94	1.87	1.37
2.0	1.83	1.75	1.75	1.76	1.39

Neutron and Gamma Shielding

SIMPLIFIED SHIELD THICKNESS CALCULATION

perform radiation measurements to verify these calculations

I = shielded exposure rate

I_0 = unshielded exposure rate

n = number of shielding layers (tenth or half)

I = $I_0 \times 0.1^n$ for tenth value thickness

I = $I_0 \times 0.5^n$ for half value thickness

Radiation Streaming

Consider the potential for radiation streaming thru gaps in the shielding. Design the shielding to minimize gaps and perform a comprehensive survey after the shielding is in place.

Stay-Time Calculation

Stay-time calculations are typically used to determine how long an individual can remain in an area with elevated radiation fields until they reach some pre-determined dose limit. The principles can also be applied to airborne areas.

Stay-time = Allowable exposure/exposure rate

example; allowable exposure is 100 mR

exposure rate is 25 mR/hr

Stay-time = 100 mR / 25 mR/hr = 4 hours

Beta Dose Rates in rad/hr per mCi

MeV	1 cm	10 cm	30 cm	60 cm	90 cm	1.0 m
0.15	1,200	1.7	0	0	0	0
0.25	1,000	2.2	0.1	0	0	0
0.30	900	3.6	0.1	0	0	0
0.50	750	5.2	0.4	0.05	0.01	0
0.75	650	5.0	0.5	0.05	0.01	0
1.0	550	4.6	0.4	0.1	0	0
1.25	450	4.3	0.4	0.1	0.04	0.02
1.50	400	4.0	0.4	0.1	0.04	0.02
1.75	350	3.4	0.4	0.1	0.04	0.02
2.00	340	3.6	0.4	0.1	0.04	0.02
2.25	320	3.3	0.4	0.1	0.04	0.02

Beta dose should be treated as a “shallow” dose and should not be summed with “deep” doses. This chart should also be used to determine beta+ doses from positron emitters.

Half-value Thickness vs Beta Energy

Isotope	Emax (MeV)	Half-Value Thickness mg / cm ²
C-14	0.156	2
Tc-99	0.292	7.5
Cl-36	0.714	15
Sr/Y-90	0.546 / 2.284	150
U-238 Betas from short lived progeny	0.191 / 2.281	130
P-32	1.710	150

Estimate the half-value thickness for a beta emitter.

$$\text{mg/cm}^2 = 50 \times E^2$$

where E is Emax in MeV for the beta emitter

This equation tends to underestimate the half-value thickness for low energy betas and overestimate the half-value thickness for high energy betas.

Positron Emitters Beta+ Energy and % Abundance

	Half-life	MeV (%)
C-11	20.3 m	0.960 (99.8%)
N-13	9.97 m	1.199 (99.8%)
O-15	122 s	1.732 (99.9%)
F-18	1.83 h	0.634 (96.7%)
Na-22	2.605 y	0.546 (89.8%)
Al-26	7.3E5 y	3.210 (100%)
V-48	15.98 d	0.697 (50.1%)
Mn-52	5.591 d	2.633 (94.9%)
Co-56	77.3 d	1.458 (19.0%)
Ni-57	35.6 h	0.737 (7.0%), 0.865 (35.3%)
Co-58	70.88 d	0.475 (14.9%)
Cu-62	9.74 m	2.926 (97.2%)
Zn-65	243.8 d	0.330 (1.4%)
Ga-68	67.7 m	0.822 (1.2%), 1.899 (89.1%)
As-74	17.8 d	0.945 (26.1%), 1.540 (3.0%)
Rb-82	1.26 m	2.601 (13.1%), 3.378 (81.8%)

Several of the positron emitters are useful in PET studies. That usefulness is somewhat offset by the cost of producing the radionuclides and the added complexity of radiation protection. For all of the positron emitters the energy of the Beta+ must be considered. Refer to the table of Beta Dose Rates for estimates of beta+ radiation exposure. Also, consider the annihilation photons when the positron comes into contact with a beta-, annihilating their masses and producing two 511 KeV photons. These photons present an external radiation hazard. For the patient undergoing a PET scan the combination of the positron energy and the photon energy must be considered.

Combining Radiation Types to Determine Total Dose

An individual radionuclide may have several different types of emissions. Those different types of emissions and the short-lived progeny of the individual radionuclide must be considered when determining a total dose.

Particulate radiation should be treated as a “shallow” dose while photons and neutrons should be treated as a “deep” dose and these two types of doses should not be summed.

This example with sodium-22 will clarify this concept.

Na-22	2.605 y	Beta+	0.546 MeV (89.8% Abundance)
1 mCi		Gamma	1.275 MeV (99.9% Abundance)

From the table of Beta Dose Rates we find 320 rad/hr at 1 cm and 0.4 rad/hr at 30 cm. The near contact dose rate is much higher than the dose rate at 30 cm.

Using 6CEN for the gamma dose rate we find;

$$6\text{CEN} = 6 \times 1 \text{ mCi} \times 1.275 \text{ MeV} \times 0.999 = 7.64 \text{ mRem/hr at 30 cm.}$$

We can also use 6CEN for the annihilation photons from the positron.

$$6\text{CEN} = 6 \times 1 \text{ mCi} \times 0.511 \text{ MeV} \times 2 \times 0.898 = 5.51 \text{ mRem/hr at 30 cm.}$$

The “shallow” dose from the positron at 30 cm is 400 mrad/hr and the “deep” dose from the gamma and photon radiation is $7.64 \text{ mRem/hr} + 5.51 \text{ mRem/hr} = 13.15 \text{ mRem/hr}$.

Shallow Dose Correction Factor

In accordance with 10CFR20 and 10CFR835 deep dose equivalent shall be used for posting of radiation areas. Shallow dose equivalent shall be reported separate from deep dose equivalent. Deep dose equivalent is the sum of the gamma and neutron deep dose equivalents. Shallow dose includes low-energy photons and charged particles such as betas, positrons, and protons. Alpha particles are not included in shallow dose.

The following applies to vented air ionization chambers with a window density thickness of 7 mg/cm^2 and a moveable shield with a density thickness of $1,000 \text{ mg/cm}^2$.

Determining the need to report a shallow dose;
If the Open Shield Reading divided by the Closed Shield Reading is equal to or greater than 1.2, then perform a shallow dose survey.

Calculate the shallow dose rate using this equation;
(Open Shield Reading - Closed Shield Reading) x CF
Obtain the **CF** (Correction Factor) from experimental or published data for the specific detector and radiation source(s).

Typical correction factors for betas range between 2 and 5 (multipliers).

Typical correction factors for low energy photons range between 0.1 and 1 (multipliers).

Low energy photons that penetrate the closed shield of the ion chamber and produce a response in the instrument are part of the “deep” dose.

NEUTRON SHIELD THICKNESS

$$I = I_0 e^{-\sigma N x}$$

where; I = final neutron flux rate

I_0 = initial neutron flux rate

σ = shield cross section in square centimeters

N = number of atoms per cm^3 in the shield

x = shield thickness in centimeters

example:

A dosimetry phantom is designed to simulate the composition of the human body. Ten % by weight is hydrogen. Assume a density of 1 and a shield cross section of hydrogen of 0.1 barns. A barn is $1\text{E}-24 \text{ cm}^2$. N , the number of atoms per cm^3 , is 10% of Avogadro's number, so N equals $6\text{E}22$ hydrogen atoms per cm^3 . Assume the phantom thickness is 30 cm.

$$I_0 = 5,000 \text{ n/cm}^2 / \text{s}$$

$$\sigma = 1\text{E}-25 \text{ cm}^2 \text{ (0.1 barns)}$$

$$N = 6\text{E}22 \text{ atoms per cm}^3$$

$$x = 30 \text{ centimeters thick}$$

$$-\sigma N x = 1\text{E}-25 \text{ times } 6\text{E}22 \text{ times } 30 = -0.18$$

$$I = I_0 e^{-\sigma N x}$$

$$I = 5,000 \text{ n/cm}^2 / \text{s} e^{-0.18}$$

$$I = 5,000 \text{ n/cm}^2 / \text{s} \times 0.835 = 4,175 \text{ n/cm}^2 / \text{s}$$

The attenuation of the neutron flux by the phantom is about 16%.

Neutron Half-Value Layers in centimeters

Energy in MeV	1	5	10	15
Polyethylene	3.7	6.1	7.7	8.8
Water	4.3	6.9	8.8	10.1
Concrete	6.8	11	14	16
Damp soil	8.8	14.3	18.2	20.8

example:

How many half-value layers of polyethylene are needed to attenuate a 100 mRem/hr 5 MeV neutron source to 5 mRem/hr? How thick does the polyethylene need to be?

$$I = I_0 \times 0.5^n$$

$$I = 5 \text{ mRem/hr}$$

$$I_0 = 100 \text{ mRem/hr}$$

n = the number of half-value layers

$$I/I_0 = 0.5^n$$

$$5/100 = 0.05 = 0.5^n$$

$$\ln 0.05 = n \times \ln 0.5$$

$$\ln 0.05 / \ln 0.5 = n$$

$$-2.996 / -0.693 = n$$

$$4.32 = n$$

It will take 4.32 half-value layers of polyethylene to reduce attenuate the neutron source.

4.32 half-value layers is $4.32 \times 6.1 \text{ cm} = 26.4 \text{ cm}$

Exposure Rate in an Air-Filled Ion Chamber

$$X = I / m [1 / (2.58E-4 C / kg) - R]$$

X = exposure rate (R / sec)
I = current (amperes)
m = mass of air in chamber (kg)

% Resolution of a Gamma Spec System

% R = FWHM / peak energy x 100 = % resolution
FWHM = peak energy width at full width half-max height
peak energy = photopeak energy of interest

True Count Rate Based on the Resolving Time of a Gas-Filled Detector

$$R_C = R_o / (1 - R_o Y) = \text{true count rate}$$

R_o = observed count rate
Y = resolving time

Specific Gamma-Ray Constant (Γ) for Source Activity (A)

$$\Gamma = \phi E_\gamma (\mu_{en} / \rho)_{air} e / W$$

Γ = specific gamma constant (R-cm² / hr-A)
 ϕ = photon fluence rate (γ / cm²-hr)
 E_γ = gamma photon energy (MeV)
 (μ_{en} / ρ) = density thickness of air (g / cm²)
e = electron charge (Coulombs)
W = average amount of energy to produce an ion pair in air (eV)

Dose Rate (D) to Air from a Point Beta Source

$$D = 300 A / d^2 = \text{rad / hr}$$

A = source activity in curies
d = distance from source in feet

Photon Fluence Rate ϕ from a Point Source

- $\phi = AY / 4\pi r^2 =$ photon fluence rate ($\gamma / \text{cm}^2\text{-hr}$)
 $A =$ source activity (decay per hr)
 $Y =$ photon yield ($\gamma /$ decay)
 $r =$ distance from point source (cm)

Exposure Rate (X) from a Point Source

$$X \text{ (R/hr)} = \Gamma A / r^2$$

- $\Gamma =$ specific gamma ray constant (R/hr @ 1 meter per Ci)
 $A =$ activity of source in curies
 $r =$ distance from source in meters

Exposure Rate (X) from a Line Source

Inside $L / 2$: $X_1 (d_1) = X_2 (d_2)$

Outside $L / 2$: $X_1 (d_1)^2 = X_2 (d_2)^2$

$d_1 =$ distance from source at location 1

$d_2 =$ distance from source at location 2

$L =$ length of line

Note that outside of $L / 2$ the equation is the same as the inverse square law.

Exposure Rate (X) from a Disk Source

$$X \text{ (R/hr)} = \pi R^2 A_a \Gamma \times \ln[(R^2 + D^2) / D^2] / R^2$$

$\Gamma =$ R/hr @ 1 meter per Ci

$A_a =$ activity per unit area (curies per sq. meter)

$R =$ radius of source surface in meters

$D =$ distance from source surface in meters

Simplify the formula by canceling the R^2 s

$$X \text{ (R/hr)} = \pi A_a \Gamma \times \ln[(R^2 + D^2) / D^2]$$

Inverse Square Law

$$X_1 (D_1)^2 = X_2 (D_2)^2$$

X_1 = Measured exposure rate

D_1^2 = Distance from source for the measured exposure rate

X_2 = Exposure rate to be calculated

D_2^2 = New distance from the source

Applying the Inverse Square Law to Dose Reduction

Given: A high activity source at an unknown distance.

Find: Exposure rate from the source at 30 cm without approaching closer to the source.

X_2 is measured exposure rate at distance Y

X_3 is measured exposure rate at distance Y + 100 cm

$$X_2 (Y)^2 = X_3 (Y + 100 \text{ cm})^2$$

$$Y^2 = X_3 (Y + 100 \text{ cm})^2 / X_2$$

Set up this equation by entering the exposure rates you measured at distances Y and Y + 100 cm

Let us assume 100 mR/hr and 50 mR/hr for those two points.

$$Y^2 = 50 (Y + 100 \text{ cm})^2 / 100 = 0.5Y^2 + 100Y + 5,000$$

simplify this to $Y^2 - 200Y - 10,000 = 0$

This quadratic equation can be factored into two answers.

The positive answer for Y is 241.42 cm.

Now we know the distance for exposure rate X_2 and we can calculate the exposure rate at any distance.

The exposure rate at 30 cm would be 6,476 mR/hr but we were able to calculate that exposure rate without entering the High Radiation Area.

A simpler method without having to factor a quadratic equation is to back AWAY from the source until the exposure rate is 1/4 of the initial rate. The distance you moved away is equal to the original distance to the source. Now you can use the inverse square law to calculate the 30 cm exposure rate.

A comparison of signal levels for various counting gases

Counting Gas	ω Factor eV / ion pair	Gas Density (g / L)
Air	33.8	1.2928
Ar	26.4	1.8
He	41.3	0.183
H ₂	36.5	0.09
N ₂	34.8	1.25
O ₂	30.8	1.43
CH ₄	27.3	0.717
Ne	36.2	0.9
Xe	21.5	5.9
Ne + 0.5 % Ar	25.3	0.909
Ar + 0.5 % C ₂ H ₂	20.3	1.75
Ar + 0.8 % CH ₄	26.0	1.78
Ar + 10 % CH ₄ (P-10)	26.0	1.616

Use this equation to calculate the current flow in amps for an ion chamber.

$$1 \text{ mR/hr} = \frac{8.71\text{E-}16 \times V \times P \times \text{fill gas g / l}}{T \times \omega \text{ for fill gas}}$$

where; V is chamber volume in cc,
 P is chamber pressure in mm Hg,
 T is 273.15 + °C,
 fill gas density in grams per liter,
 ω for fill gas

Table 1 of DOE 5400.5

Radionuclides	Surface Activity Guidelines		
	Ave	Max	Removable
Group 1: Transuranics, ¹²⁵ I, ¹²⁹ I, ²²⁷ Ac, ²²⁶ Ra, ²²⁸ Ra, ²²⁸ Th, ²³⁰ Th, ²³¹ Pa	100	300	20

INSTRUMENT SELECTION AND USE

Exposure/Absorbed Dose Rates (photon) - Ion Chamber, Energy Compensated GM, Tissue-Equivalent Plastic

Dose Equivalent Rates (neutron) - BF_3 or He^3 moderator, Neutron-Proton Recoil (Rossi Detector, Liquid Plastic Scintillator, Plastic/ZnS Scintillator), LiGdBO_3 -loaded Plastic

Beta and activity - Proportional Counter, GM, Plastic Scintillator

Alpha activity - Proportional Counter, ZnS Scintillator, Air Proportional, Solid-state Silicon, Plastic Scintillator

Alpha + beta activity - Proportional Counter, Plastic/ZnS Scintillator, Plastic Scintillator, Solid-state Silicon

Gross gamma activity - NaI, CsI

X-ray spectroscopy - Si(Li)

Gamma spectroscopy - HPGe, CZT, HgI, CsI, LaBr

Alpha spectroscopy - Frisch Grid, Solid-state Silicon

Beta spectroscopy - BGO, Plastic Scintillator, Silicon

1. Select an instrument appropriate for the isotope(s) to be surveyed for.
2. Check instrument for a valid calibration sticker and for damage that would prevent it (them) from operating acceptably.
3. Check the battery condition.
4. Perform an operational (or performance) check.
5. Determine the isotope(s) correction factor to be applied to the instrument.
6. Calculate the instrument's MDA and compare to survey criteria.
7. If the instrument does not meet all of the above criteria, then replace the instrument (or change/charge the batteries) or change your survey technique so that the instrument's MDA will meet the survey criteria.
9. Perform and then document the survey.

6CEN

The 6CEN equation can be used to calculate the exposure rate in R/hr at one foot for x-ray and gamma radiation point sources with energies between 70 KeV and 2 MeV.

$$R/\text{hr at 1 foot} = 6\text{CEN}$$

where; C = curies of radioactive material

E = photon energy in MeV

N = abundance of that photon expressed as a decimal

1.6TBqEN

The same formula in Sv/h is given by 1.6 TBqEN, where TBq is the number of terabecquels.

$$\text{Sv/hr at 30 cm} = 1.6\text{TBqEN}$$

where; TBq = quantity of radioactive material

Airborne Activity General Dispersion Model

Assume a 1 μCi (37 kBq) release of respirable Pu^{239} inside a large room measuring 12 x 12 x 3 meters with a ventilation turnover rate of 7 volumes per hour. The General Dispersion Model uses this 2π formula for volume.

Volume in cm^3	30 cm	1 M	10 M
@ distance R	5.65E4	2.09E6	2.09E9

Concentration @ distance R

in $\mu\text{Ci} / \text{cc}$	1.77E-5	4.78E-7	4.78E-10
in Bq / M^3	6.55E5	1.77E4	17.7
in DAC	8.85E6	2.39E5	239

Time for airborne wave front to reach distance R

13 sec	43 sec	7.15 min
--------	--------	----------

1 CFM sample for 1 week equals 10,080 CF (285.4 M^3)

2 CFM sample for 1 week equals 20,160 CF (571 M^3)

Airborne Radioactivity (long-lived)

C_S	=	$R_N / (V \times \epsilon \times SA \times CE \times CF)$
C_S	=	activity concentration at end of sample run time
R_N	=	net counting rate
V	=	sample volume
ϵ	=	detector efficiency
SA	=	self-absorption factor
CE	=	collection efficiency
CF	=	conversion from disintegrations per unit time to activity

Airborne Radioactivity (short-lived)

C_S	=	$R_N / [V \times \epsilon \times SA \times CE \times CF \times (1 - e^{-\lambda t_s}) \times (e^{-\lambda t_d})]$
t_s	=	sample count time
t_d	=	time elapsed between end of sample run time and start of sample count time

RESPIRATORY PROTECTION FACTORS (PF) 10CFR20

Device	Mode	Particulates	Vapors	PF
Air-purifying half-mask	D	Y	N	10
Air-purifying full-face	D	Y	N	50
Air-purifying full-face	PP	Y	N	1000
Supplied-air hood	PP	Y	Y	1000*
Supplied-air full-face	PP	Y	Y	2000
SCBA	D	Y	N	50
SCBA	PD	Y	Y	10,000

* 2000 for supplied-air hood if run at max flow with calibrated flow gauge.

Bubble suits have been used in Pu atmospheres as high as 1,000,000 DAC. Supplied-air respirators are worn inside the bubble suits and real-time air monitoring INSIDE the bubble suits is performed.

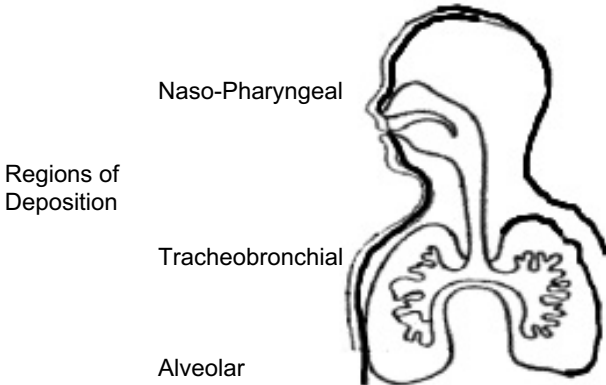

Ventilation Rates

Ventilation rates of work areas for health physics and industrial hygiene requirements is typically 6 to 7 volume turnovers per hour.

Calculate the ventilation rate in CFM to ventilate a room at 7 volume turnovers per hour given room dimensions of 30 feet by 30 feet by 10 feet. Volume of the room is $30 \times 30 \times 10 = 9,000$ cubic feet. Seven volume turnovers per hour would be 7 times 9,000 cubic feet or 63,000 cubic feet per hour (1,050 CFM) room ventilation rate.

Lung Deposition from ICRP 30

AMAD	NP	TB	
μ	Naso-pharanx	Trachea-bronchus	Alveolar
0.1	0.01	0.08	0.61
1	0.3	0.08	0.25

AIR MONITORING

Concentration

Concentration is activity per volume of air and may be stated as dpm / cubic meter, $\mu\text{Ci} / \text{ml}$, or Bq / cubic meter. DAC (Derived Air Concentration) is another way to express airborne radioactivity concentrations as relative hazards.

DPM	=	Sample CPM / Eff (CPM / DPM)
1 μCi	=	2.22 E6 DPM
1 DPM / M^3	=	4.5 E-13 $\mu\text{Ci} / \text{ml}$
1 $\mu\text{Ci} / \text{ml}$	=	2.22 E12 DPM / M^3
1 Bq	=	1 DPS
DPM / M^3	=	CPM/(Eff x total sample volume in M^3)
$\mu\text{Ci} / \text{ml}$	=	CPM/(Eff x 2.22 E6 DPM / μCi x total sample volume in ml)
Bq / M^3	=	CPM / (Eff x 60 DPM / Bq x total sample volume in M^3)
DAC	=	$\mu\text{Ci} / \text{ml}$ ($\mu\text{Ci} / \text{ml}$ per DAC {DAC Factor})
1 DAC-h	=	1 DAC exposure for 1 hour
1 DAC-h	=	2.5 mrem = 25 μSv
1 DAC for Pu239	is	11.1 DPM / M^3

Calculate the number of DAC-h on a filter by this formula

$$\# \text{ DAC-h} = \frac{\# \text{ of DPM on filter}}{(\text{Sample flow rate in LPM} \times 1.332\text{E}11 \times \text{DAC factor})}$$

Calculate the DPM on a filter to reach 8 DAC-h

$$\text{DPM} = 8 \text{ DAC-h} \times \text{flow rate in LPM} \times 1.33\text{E}11 \times \text{DAC factor}$$

Calculate the DAC level on a filter from the # of DPM

$$\text{DAC} = \frac{\# \text{ of DPM}}{(\text{DAC factor} \times \text{LPM} \times \text{time in minutes} \times 2.22\text{E}9)}$$

AIR FLOW METER CORRECTIONS

Mass Flow Meters

$$Q_S = Q_A (P_A / P_S \times T_S / T_A)$$

$$Q_A = Q_S (P_S / P_A \times T_A / T_S)$$

where; Q_S is the STP flow rate

Q_A is the ambient flow rate

P_S is STP pressure

P_A is the ambient pressure

T_S is STP temperature

T_A is the ambient temperature

Rotameter Corrections

$$Q_S = \frac{Q_I \times P_S / P_A \times T_S / T_A}{\sqrt{(P_S / P_I \times T_A / T_S)}}$$

where; Q_I is the rotameter flow indication

P_I is the actual pressure inside the rotameter.

This correction assumes the rotameter markings are correct at STP. The actual pressure inside the rotameter should be used in the calculations.

For personnel protection against particulate airborne radioactivity ambient sample volumes instead of volumes corrected to STP should be used for calculations. The ambient respiratory rate will remain the same as atmospheric pressure changes from STP up to an elevation of approximately 12,000 feet (3,660 Meters).

Filter Media Characteristics for Alpha CAMs

Filter Type	Pore Size	Filter ΔP	FWHM keV
Millipore			
Fluoropore	5 um	0.5"Hg	370
Fluoropore	3 um	0.8"Hg	300
SMWP	5 um	2.0"Hg	450
SSWP	3 um	3.1"Hg	350
AW19	1.2 um	3.8"Hg	450
Durapore	5 um	4.3"Hg	490
AP40	0.7 um	2.6"Hg	490
Bladewerx			
Speclon 1.5	1.5 um	2.6"Hg	300
Speclon 5.0	5 um	0.4"Hg	370
Whatman			
GFA	0.3 um	2.8"Hg	490
EPM 2000	0.6 um	1.8"Hg	1,000
Gelman			
A/E Glass	1.0 um	2.3"Hg	1,000
Versapor 3000	3.0 um	2.3"Hg	450
Hollingsworth & Vose			
HV LB5211	0.3 um	1.0"Hg	650

The rated pore size is for >99.99% collection efficiency for that size particle and greater. All of these filters have >99% collection efficiency for particles as small as 0.3 um. The stated pressure drop is for a 40 mm collection diameter with an air flow rate of 2 ACFM and barometric pressure of 23.1"Hg. The FWHM is for Po-214 at 7.68 MeV and was determined using a 25 mm collection diameter and a 25 mm diameter diffused junction detector with a spacing of 4 mm. The pressure drop will be higher and the FWHM will be broader at higher barometric pressures.

STCs = Special Tritium Compounds

1 = Water (HTO) form	21 = Methyl
2 = Elemental (HT form)	22 = 12 h half-life
3 = water and elemental	23 = 34 yr half-life
4 = Insoluble	24 = 24 h half-life
5 = Soluble	25 = 5 h half-life
6 = Vapor form	26 = 64 h half-life
7 = As CO	27 = 12 h half-life
8 = As CO ₂	28 = 16 h half-life
9 = compounds	29 = 2 h half-life
10 = Vapor	30 = 3 h half-life
11 = Inorganic	31 = 1 h half-life
12 = Carbonyl	32 = Organic
13 = 66 min half-life	33 = radon-220/222 with short-lived progeny
14 = 122 min half-life	34 = with progeny removed
15 = 69 min half-life	35 = with progeny present
16 = 5 h half-life	36 = 1E+05 yr half-life
17 = 16 min half-life	37 = 22 h half-life
18 = 6 d half-life	38 = half-life less than 2 hours
19 = 9 h half-life	
20 = 10 min half-life	

For any radionuclide not listed in these tables with decay mode other than alpha emission or spontaneous fission and with radioactive half-life less than two hours, the DAC value shall be 6E-06 uCi/mL (2E+04 Bq/M³).

The DAC values listed for both 10CFR20 and 10CFR835 were truncated after being calculated from the appropriate ALI values. For 10CFR835 the ALI values were taken from ICRP 68.

Characteristic X-Rays (KeV) of the Elements

These characteristic x-rays originate in the shell of the atom and can be used to identify specific elements but not a specific isotope. These characteristic x-rays are emitted from the shell of the atom after sufficient energy in the form of thermal heat, laser, micro- waves, or other type of energy is directed into the atom shell.

COUNTING STATISTICS

$$\text{Minimum Detectable Activity (MDA)} \quad \text{MDA} = \frac{k^2 + 2k\sqrt{R_B} \times t_{S+B} \times (1+t_{S+B}/t_B)}{t_{S+B} \times \text{Eff}}$$

$$\text{Minimum Detectable Count Rate} \\ \text{LLD} = L_D = \text{MDCR} \quad \frac{k^2 + 2k\sqrt{R_B} \times t_{S+B} \times (1+t_{S+B}/t_B)}{t_{S+B}}$$

$$L_C = k \times \sqrt{R_B \times t_{S+B} + R_B \times t_B}$$

k = 1.645 (for 95% Confidence Level)

t_{S+B} = sample count time

t_B = background count time

R_B = background count rate

Eff = efficiency of the detector (expressed as a decimal)

R_{S+B} = sample count rate

LLD is Lower Limit of Detection

L_D is the Decision Level

L_C is the Critical Level and generally expressed as counts (or signal level) above background

K	0.674	1	1.645	1.96	2.58	3.00
% C.L.	50	68.3	90	95	99	99.7

If R_B is in DPM it must be converted to CPM before using the above equations.

A 'k' of 1.645 is used as the 95% confidence level for a two-tailed distribution.

Gaussian statistics should be used for ≥ 30 counts and Poisson statistics for < 30 counts. The typical formulas such as those above are an attempt to blend the two statistical models.

MDA when background and sample count times are one minute and k is 1.645.

$$\frac{3 + 4.65 \sqrt{R_B}}{\text{Eff}}$$

MDA when background count time is ten minutes and sample count time is one minute and k is 1.645.

$$\frac{3 + 3.45 \sqrt{R_B}}{\text{Eff}}$$

POISSON STATISTICS

For Poisson distributions the following logic applies.

P_n is the probability of getting count "n"

$$P_n = \mu^n e^{-\mu} / n!$$

n = the hypothetical count

μ = true mean counts

If the true mean, μ , is 3, then there is a 5% probability that we will get a zero count and a 95% probability that we will get greater than zero counts. There is a 65% probability that we will get 3 or more counts.

α = Probability of Type I error
 β = Probability of Type II error

B = Background
 L_C = Critical detection level
 L_D = Minimum significant activity level

A gram-molecular weight of any gas contains Avogadro's number, N_0 (6.02252 E23) atoms and occupies a volume of 22,414 cm ³ at STP.	

Temperature

$$^{\circ}\text{C} = (^{\circ}\text{F} - 32)(5/9)$$

$$^{\circ}\text{K} = ^{\circ}\text{C} + 273.1$$

$$^{\circ}\text{F} = ^{\circ}\text{C} \times 1.8 + 32$$

$$^{\circ}\text{R} = ^{\circ}\text{F} + 459.58$$

SURFACE AREA AND VOLUME CALCULATIONS

Triangle A (area) = $\frac{1}{2} \times b \times h$;
where b is the base and h is the height of the triangle

Rectangle A (area) = $a \times b$;
where a and b are the lengths of the sides

Rectangular Box V (volume) = $w \times l \times h$;
where w is the width, l is the length, and h is the height

Parallelogram (a 4-sided figure with opposite sides parallel)
 A (area) = $a \times h$; or $a \times b \times \sin \Theta$;
where a and b are the length of the sides, h is the altitude (or vertical height), and Θ is the angle between the sides

Trapezoid (a 4-sided figure with two sides parallel)
 A (area) = $\frac{1}{2} \times h (a + b)$;
where a and b are the length of the sides and h is the height

Regular polygon of n sides
 A (area) = $\frac{1}{4} \times n \times a^2 \times \cotangent (180^\circ / n)$;
where a is the length of a side and n is the number of sides

Circle A (area) = $\pi \times r^2$; or $\frac{1}{4} \times \pi \times d^2$;
where r is the radius and d is the diameter

Cube A (area) = $6 \times a^2$;
 V (volume) = a^3 ;
where a is the length of a side

Cylinder A (area) = $2 \times \pi \times r \times h$;
 V (volume) = $\pi \times r^2 \times h$;
where r is the radius and h is the length of the height

Sphere A (area) = $4 \times \pi \times r^2$; or $\pi \times d^2$;
 V (volume) = $\frac{4}{3} \times \pi \times r^3$ or $\frac{1}{6} \times \pi \times d^3$
where r is the radius and d is the diameter

ELECTROMAGNETIC SPECTRUM

1E6	3E-4	1.24E-15	TV shortwave radio

$$\begin{aligned}
 \lambda \text{ (meters wavelength)} &= 300 / F &= 1.24E-9 / \text{keV} \\
 F \text{ (frequency MHz)} &= 300 / \lambda &= 2.419E11 \times \text{keV} \\
 E \text{ (keV)} &= 1.24E-9 / \lambda &= F / 2.419E11
 \end{aligned}$$

RULES OF THUMB FOR ALPHA PARTICLES

1. An alpha particle of at least 7.5 MeV energy is needed to penetrate the nominal protective layer of the skin (7 mg / cm² or 0.07 mm).

2. The alpha emissions and energies of the predominant particles from 1 µg of several common materials are:

	DPM per µg	Alpha Energy (MeV)
²³⁸ Pu	39,000,000	5.50 (72%)
²³⁹ Pu	140,000	5.15 (72.5%)
²⁴⁰ Pu	500,000	5.16 (76%)
²⁴² Pu	8,700	4.90 (76%)
^a Natural U	1.5	4.20 (37%), 4.77 (36%)
Oralloy (93% ²³⁵ U)	160	4.39 (~ 80%)
^b Natural Th	0.5	4.01 (38%), 5.43 (36%)
D-38 (DU, tuballoy)	1	4.20 (~ 60%)

^a Includes ²³⁴U in equilibrium.

^b Includes ²²⁸Th in equilibrium. Depending upon the time since chemical separation, ²²⁸Th can decrease to give a net disintegration rate lower than 0.5.

^c With 2p (50%) geometry, the surface of a thick uranium metal (tuballoy) source gives ~ 2400 alpha counts/min per cm². Depleted uranium (D-38) gives ~ 800 alpha cpm/cm².

3. Alpha particles lose about 0.8 MeV per mg/cm² density thickness of the attenuating material.
4. Detector window thicknesses cause alpha particles to lose energy at about 0.8 MeV per mg/cm² of window thickness. Therefore, a detector with a window thickness of 3 mg/cm² (such as sealed gas-proportional pancake alpha/beta detectors and pancake GM detectors) will not detect alpha emitters of less than 3 MeV.

5. Air-proportional alpha detectors have a flatter energy vs efficiency response than sealed gas-proportional, alpha scintillator, alpha/beta scintillator, or GM detectors. This is due to several factors. One factor is the typically thinner entrance windows on air-proportional alpha detectors compared to beta detectors and alpha and beta scintillator detectors whereby more of the initial alpha particle energy enters the active volume of the air-proportional compared to other detectors. A second factor is the relatively shallow depth of the air-proportional detector compared to the path length of the alpha particle in air which leads to the alpha pulses being of similar height for any alpha particle energy above a threshold.

6. Alpha particle energy transfer to air

6 MeV alpha particles produce 40,000 Ion Pairs per cm

4 MeV alpha particles produce 55,000 Ion Pairs per cm

ω for air is 34 eV per Ion Pair

therefore;

6 MeV alpha particles lose 1.18 MeV per cm of air

4 MeV alpha particles lose 1.87 MeV per cm of air

Alpha particle range in cm of air at 1 atmosphere

$R_a = 0.56 E$ ($E < 4$ MeV)

$R_a = 1.24 E - 2.62$ ($E > 4$ MeV)

Alpha particles lose about 60 KeV of energy per mm of air at STP.

RULES OF THUMB FOR BETA PARTICLES

1. Beta particles of at least 70 keV energy are required to penetrate the nominal protective layer of the skin.
2. The average energy of a beta-ray spectrum is approximately one-third the maximum energy.
3. The range of beta particles in air is $\sim 12 \text{ ft (3.6 m) / MeV}$.
4. The range of beta particles (or electrons) in grams / cm^2 (thickness in cm multiplied by the density in g / cm^3) is approximately half the maximum energy in MeV. This rule overestimates the range for low energies (0.5 MeV) and low atomic numbers, and underestimates for high energies and high atomic numbers.
5. The exposure rate in rads per hour in an infinite medium uniformly contaminated by a beta emitter is $2.12 EC / \rho$ where E is the average beta energy per disintegration in MeV, C is the concentration in $\mu\text{Ci / cm}^3$, and ρ is the density of the medium in grams/cm^3 . The dose rate at the surface of the mass is one half the value given by this relation. In such a large mass, the relative beta and gamma dose rates are in the ratio of the average energies released per disintegration.
6. The surface dose rate through 7 mg / cm^2 from a uniform thin deposition of $1 \mu\text{Ci / cm}^2$ is about 9 rads/h (90 mGy/h) for energies above about 0.6 MeV. Note that in a thin layer, the beta dose rate exceeds the gamma dose rate for equal energies released by ~ 100 .

7. The bremsstrahlung from a 1 Ci P^{32} aqueous solution in a glass bottle is ~ 3 mrad/h ($30 \mu\text{Gy/h}$) at 1 m.

8. Half-value thickness vs beta energy

Isotope	β max energy (KeV)	Half-Value Thickness
Tc^{99}	292	7.5 mg / cm^2
Cl^{36}	714	15 mg / cm^2
Sr/Y^{90}	546 / 2270	150 mg / cm^2
U^{238}	Betas from short lived progeny 191 / 2290	130 mg / cm^2

9. Estimating beta energy using a paper shield

- The density thickness of typical notepaper of 20 pound weight is 7.5 mg/cm^2 .
- Take a reading with your beta detector of the surface contamination you wish to estimate the energy of.
- A single sheet of notepaper will stop all but the most energetic of alpha particles, will have virtually no effect on gamma radiation, and will only stop very low energy beta particles such as C^{14} .
- A single sheet of notepaper will reduce the count rate from Tc^{99} by $\frac{1}{2}$.
- Continue adding more sheet of notepaper until the net count rate is less than $\frac{1}{2}$ the unshielded count rate.
- Multiply the number of sheet of notepaper necessary to reduce the count rate to $\frac{1}{2}$ by 7.5 mg/cm^2 . That density thickness is your half-value layer and you can compare the required density thickness with the table in step 8 or some other reference.

RULES OF THUMB FOR GAMMA RADIATION

1. The range of gamma rays (any photon) for energies from eV to 10 MeV in air is from a few mm to 100 meters. The range of those photons in water is from a few mm to several cm.
2. The dose rate 1 m above a flat, infinite plane contaminated with a thin layer (1 Ci / m²) of gamma emitters is:

Energy (MeV)	Dose Rate	
	rem/h	mSv/h
0.4	7.2	72
0.6	10	100
0.8	13	130
1.0	16	160
1.2	19	190

3. The dose rate in rem/h per hour in an infinite medium uniformly contaminated by a gamma emitter is $2.12 EC / \rho$, where C is the number of microcuries per cubic centimeter, E is the average gamma energy per disintegration in MeV, and ρ is the density of the medium. At the surface of a large body, the dose rate is about half of this. At ground level (one-half of an infinite cloud), the dose rate from a uniformly contaminated atmosphere is 1,600 EC rem/h per $\mu\text{Ci} / \text{cm}^3$.
4. The radiation scattered from the air (skyshine) from a 100 Ci ⁶⁰Co source 30 cm behind a 1 m high shield is ~ 100 mR/h (1 mSv/h) at 15 cm from the outside of the shield.

RULES OF THUMB FOR NEUTRONS

1. The number of neutrons per square centimeter per second at distance R from a small source emitting Q neutrons per second without shielding is given by;
$$n / \text{cm}^2\text{-sec} = Q / 4\pi R^2 = 0.08Q / R^2$$
2. For α , η sources use the following equation to approximate the number of neutrons per second per Ci (Q).
$$Q = 5.6E3 \times (\text{alpha particle energy in MeV})^{3.65}$$

This holds true for Be; multiply by 0.16 for B targets, by 0.05 for F, by 0.015 for Li, and 0.003 for O targets.
3. For neutron energies from 1 to 10 MeV the neutron exposure rate is approximately equal to 1 mrem/hr at 1 meter for each 1E6 neutrons per second emission rate. Multiply the neutron mrem/hr at 1 meter by 11.1 to calculate the neutron exposure rate for the same source at a distance of 30 cm.
4. For spontaneous fission the gamma exposure rate for an unshielded source is approximately twice the neutron exposure rate.
5. The range of neutrons in air for energies from 0 to 10 MeV is from a few centimeters to 100 meters.
6. The range of neutrons in water (or tissue) for energies from 0 to 10 MeV is from a few millimeters to 1 meter.
7. Neutron flux to dose rate conversion:
Fast: 1 mrem (0.01 mSv) / hr per 6 n / $\text{cm}^2\text{-sec}$
Slow: 1 mrem (0.01 mSv) / hr per 272 n / $\text{cm}^2\text{-sec}$

APPROXIMATE NEUTRON ENERGIES

cold neutrons	0 - 0.025 eV
thermal	0.025 eV
epithermal	0.025 - 0.4 eV
cadmium	0.4 - 0.6 eV
epicadmium	0.6 - 1 eV
slow	1 eV - 10 eV
resonance	10 eV - 300 eV
intermediate	300 eV - 1 MeV
fast	1 MeV - 20 MeV
relativistic	> 20 MeV

Note: A thermal neutron is one which has the same energy and moves at the same velocity as a gas molecule does at a temperature of 20 degrees C. The velocity of a thermal neutron is 2200 m / sec (~5,000 mph).

Neutron Fluence per mrem (10CFR20)

These neutron and gamma exposure rates are approximate values for the spontaneous fission process. When you are making exposure rate measurements you should take into account shielding of the source (including self-shielding), individual instrument response to both neutron and gamma radiation, isotopic mixtures, age of the material (for both decay and ingrowth), homogeneity of the material, and impurities. Refer to the Specific Activity and Characteristic Radiations of Commonly Encountered Radionuclides sections for information on gamma exposure rates and radiations from primary decay modes of these isotopes.

MISCELLANEOUS RULES OF THUMB

1. One watt of power in a reactor requires $3.1E10$ fissions per second. In a reactor operating for more than 4 days, the total fission products are about 3 Ci / watt at 1.5 min after shutdown. At 2 yr after shutdown, the fission products are approximately 75 Ci / MW-day.
2. The quantity of a short-lived fission product in a reactor which has been operated about four times as long as the half-life is given by; $Ci \approx (FY)(PL)$, where FY is the fission yield (%/100) and PL is the power level in watts.
3. Correction factor for unsealed ion chambers to STP ($0^{\circ}C$ and 760 mm of Hg) is $f = (t + 273)/(273) \times (760 / P)$ where t is the ambient temperature in degrees C and P is the ambient barometric pressure in mm of Hg.
4. The activity of an isotope (without radioactive daughter) is reduced to less than 1% after seven half-lives.

5. NATURALLY OCCURRING RADIONUCLIDES

Primordial

K^{40}

Rb^{87}

Natural U and Th

Cosmogonic

Tritium

Be^7

C^{14}

6. Unified Time, Distance, and Shielding formula for reduction of external dose.

$$\text{Rem} = \text{Initial Rem/hr} \times T \text{ in hours} \times \frac{(D_2)^2}{(D_1)^2} \times 0.5^n$$

Where: Rem is the dose after applying reduction methods
 T is the exposure time in hours
 D_1 is the initial distance to the source
 D_2 is the new distance to the source
 0.5^n is the Shielding for 'n' half-value layers

UNITS AND TERMINOLOGY

	“Special Units”	SI Units
Exposure	Roentgen	Coulombs / kg
Dose	rad (0.01 Gy)	Gray (100 rad)
Dose Equiv	rem (0.01 Sv)	Sievert (100 rem)
Activity	Curie (2.22 E12 dpm)	Becquerel (1 dps)
1 Roentgen	= 2.58 E-4 coulomb / kg in air = 1 esu / cm ³ in air = 87.7 ergs / gm in air = 98 ergs / gm in soft tissue	
1 rad	= 100 ergs / gm in any absorber	
1 Gray	= 10,000 ergs / gm in any absorber	
1 rem	= 1 rad x QF = 0.01 Sv	
H	= DQN (from ICRP 26)	
H (Dose Equiv.)	= D (absorbed dose) x Q (quality factor) x N (any other modifying factors)	

DEFINITIONS

Acute	any dose in a short period of time
Chronic	any dose in a long period of time
Somatic	effects in the exposed individual
Genetic	effects in the offspring of the exposed individual
Teratogenic	effects in the exposed unborn embryo/fetus
Stochastic	effects for which a probability exists and increases with increasing dose
Non-Stochastic (deterministic)	effects for which a threshold exists - effects do not occur below the threshold (examples; cataracts, erythema, epilation, acute radiation syndrome)

PUBLIC RADIATION DOSES

Average per capita US Dose	200 mrem (2 mSv) / yr
Living in Los Alamos (7000' elev)	327 mrem (3.27 mSv)/yr
Flying from NY to LA	2.5 mrem (25 μ Sv) / trip
Chest x-ray	10 mrem (0.1mSv)/exam
Full mouth dental x-ray	9 mrem (90 μ Sv) / exam

The external dose rate for cosmic rays doubles for each mile increase in elevation.

BACKGROUND RADIATION

Cosmic	=	28 mrem (0.28 mSv) / yr
Rocks	=	28 mrem (0.28 mSv) / yr
Internal	=	36 mrem (0.36 mSv) / yr
Medical x-rays	=	20 to 30 mrem (0.2 to 0.3 mSv)/yr
Nuclear medicine	=	2 mrem / yr
TOTAL US Ave	\approx	120 mrem / yr
US Ave H_E from radon	=	200 mrem / yr

Ave H_E from medical x-ray procedures:

Skull	20 mrem (0.2 mSv)
Upper GI	245 mrem (2.45 mSv)
Hip	65 mrem (0.65 mSv)
Chest	6 mrem (60 μ Sv),
Kidney	55 mrem (0.55 mSv)
Dental	55 mrem (0.55 mSv)

Occupational Doses	mrem /yr	mSv/yr
airline flight crew	1,000	10
nuclear power plant	700	7
Grand Central Station workers	120	1.2
medical personnel	70	0.7
DOE employees	44	0.44

RADON FACTS

1 working level	=	3 DAC Rn ²²² (including progeny)
	=	1.3E5 MeV / liter of air α energy
	=	100 pCi / liter (1E-7 uCi / mL)
	=	20.8 uJoules / M ³
1 working level-month	=	1 pCi / L in air thru evaporation

EPA ACTION LEVELS FOR RADON GAS IN HOMES

Concentration (pCi / L) Sampling Frequency

0 - 4 initial and no follow up

EPA Recommends Mitigation at \geq 4 pCi / L

4 -20 one year and follow up

20 -200 3 months and follow up

> 200 Implement radon reduction methods

4 pCi / L in living area = 1.03 working level-month = 1 rem

PROPOSED EPA ACTION LEVELS FOR RADON IN DRINKING WATER

Maximum Contaminant Level (MCL) is 300 pCi / L of radon in water of community water systems (CWS).

Alternative Maximum Contaminant Level (AMCL) is 4,000 pCi / L of radon in water of community water systems.

To comply with the AMCL limit the state or the CWS (Community Water System) must implement a Multi-Media Mitigation plan to address the radon in the air of residences. The proposed rule would not apply to CWSs that use solely surface water.

The proposed rule requires monitoring for radon in drinking water. The monitoring frequency varies from once per quarter to once in 9 years based on radon concentrations.

COMPARATIVE RISKS OF RADIATION EXPOSURE

	Estimated Days of Life Lost
Smoking 1 pack of cigarettes / day	2,370
20% overweight	985
Average US alcohol consumption	130
Home accidents	95
Occupational exposure	
• 5.0 rem (50 mSv) / year	32
• 0.5 rem (5 mSv) / year	3

OCCUPATIONAL RISKS

Occupation	Estimated Days of Life Lost
demolition	1,500
mining	1,100
firefighting	800
railroad	500
farming	300
construction	200
transportation & public utilities	160
average of all occupations	60
government	55
radiation dose of 1 rem (10 mSv) per year	50
service	45
trade	30
single radiation dose of 1 rem (10 mSv)	1.5

Relative Risk

Your overall risk of dying is 1 in 1

Heart disease	1 in 5
Cancer	1 in 7
Stroke	1 in 24
Motor vehicle accident	1 in 84
Suicide	1 in 119
Falling	1 in 218
Firearm assault	1 in 314
Pedestrian accident	1 in 626
Drowning	1 in 1,008
Motorcycle accident	1 in 1,020
Fire or smoke	1 in 1,113
Bicycle accident	1 in 4,919
Air / space accident	1 in 5,051
Accidental firearm discharge	1 in 5,134
Accidental electrocution	1 in 9,968
Alcohol poisoning	1 in 10,048
Hot weather	1 in 13,729
Hornet, wasp, or bee sting	1 in 56,789
Legal execution	1 in 62,468
Lightning	1 in 79,746
Earthquake	1 in 117,127
Flood	1 in 144,156
Fireworks discharge	1 in 340,733

MIRION
TECHNOLOGIES

*Products and services for a
wide range of radiation safety,
measurement and scientific purposes.*

*As a global leader in radiation
measurement, we are driven to
protect people, property and the
environment from the harmful effects
of ionizing radiation.*
